

# Installing Webfonts

---

London Type webfonts are supplied on a self-hosting basis, to be used in conjunction with the CSS @font-face rule. After downloading your webfont kit here's what you need to do...

1. Upload the fonts to your website and ideally place them in the same directory as your CSS files.
2. Add some code to your CSS stylesheet. For example, if just installing WOFF & WOFF 2 formats the code for our Bloomsbury OldStyle Light font would look like this (+ recommended kerning code):

```
@font-face {  
    font-family: 'LDNBloomsburyOldStyle-Light';  
    src: url('LDNBloomsburyOldStyle-Light.woff2') format('woff2'),  
    src: url('LDNBloomsburyOldStyle-Light.woff') format('woff');  
    font-weight: normal;  
    font-style: normal;  
}  
  
p {  
    text-rendering: optimizeLegibility;  
    font-feature-settings: "kern" 1;  
    font-kerning: normal;  
}
```

3. Link to your stylesheet.css file in the html of your web page (inside the <head> tags), for example:  
`<link rel="stylesheet" href="stylesheet.css" type="text/css" charset="utf-8" />`
4. Define the styling in your html & CSS with a fallback font option, for example:  
`body { font-family: "LDNBloomsburyOldStyle-Light", Georgia, serif; }`

---
